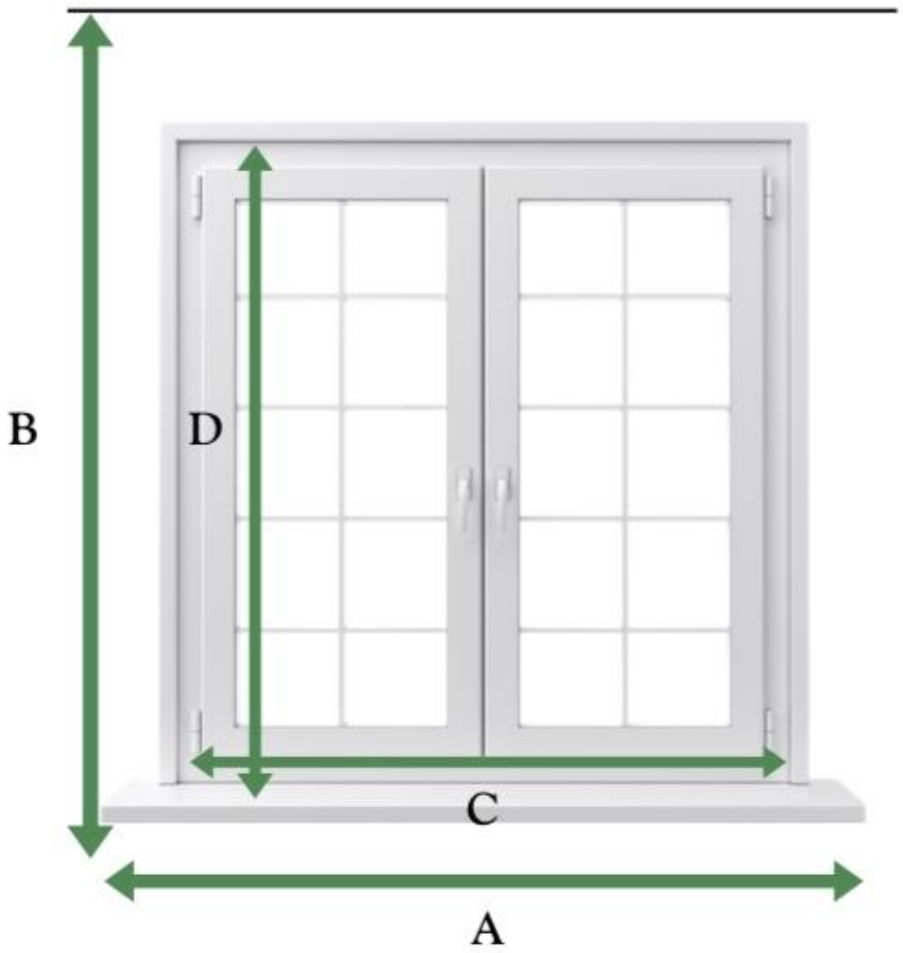
How to measure your window for blinds

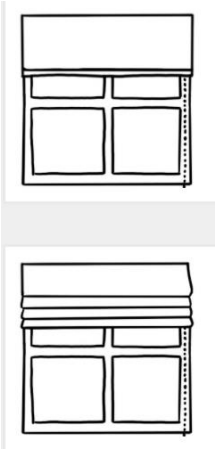


For Blinds that are within the recess we need the measurement of D &C. The measurement of the height of the window recess is D and the measurement of the width of the window recess is C.

For Blinds that are to be outside the recess we need the measurement of B & A. B is from where you would like the top of the blind to be on the wall and to 5cm below the widow sill. A is the width of the sill.

For an estimate please can you help us with the following details:

1. An approximate measurement for the blind you would like made.
2. The style, straight or cascade.



3. If you have a particular fabric in mind.
4. Would you like them blackout, interlined or just lined. As a note on interlining it helps the blind look plusher, helps to keep drafts out and helps to retain heat in the warmer months and heat out in the cooler months. It also lengthens the life of your blind in terms of sun damage.
5. Please highlight if the measurements are in the recess or outside the recess.
6. What chain finish would you like and which side should the chain be on.
7. Name the room they will be in for our reference.

It is also incredibly helpful for us to be sent photos along with this information as no two windows are often the same.

Please provide all measurements in CM.

Room Name	Window No.	Blind Type	Width (cm)	Drop (cm)	Lining
